

How to Modify Your PTC

The following steps detail how to modify your original PTC (Positive Temperature Control) module so that you can reuse it with your SNABB Turbo Intake Pipe for the S60R/V70R.

Step 1: Remove PTC from original plastic air pipe.

Step 2: Cut off rubber grommet (a box cutter works well). Clean the plastic body using a stiff brush and Brake Cleaning fluid (most effective and easiest way).

Step 3: Grind down the bottom lip of the PTC module using a sander or grinder, for example so that the lip is completely removed. A grinder on a rotary tool (e.g., Dremel) work well.

The PTC can now be installed into the SNABB metal piping!

In the rare event that you damage your original PTC, replacement units can be purchased from your local Volvo dealer: Part Number 8653644.
